Reusable pages, blocks and content models in Edge Delivery Services

AEM authoring with the Universal Editor → Edge Delivery Services (EDS)

Answers to the four questions on reusable page structure, block reuse, Articles & Insights and the content model for Events, Articles and Press Releases — plus the Adobe link for site creation from Figma with the Experience Modernization Agent.

Summary

#	Question	Short answer	How in EDS
1	Reusable page structure (e.g. Event pages)	**Yes**	AEM **page templates** for the Universal Editor + **template metadata** that applies the Event layout in code + **section/block filters** that predefine what can go where
2	Reuse blocks/sections across pages and sites	**Yes**	**Copy** / **Paste** / **Duplicate** in the Universal Editor, **copy pages** in the Sites console, **Fragments** for shared content, **MSM** / **Live Copy** across sites and languages
3	News Articles and Insights pages	One **Article template** + page **metadata** + **query index** driving listing blocks	Articles are pages; listings, filters and "related" lists are built automatically from the index
4	Content model for Events, Articles, Press Releases	**Combine** them: page templates + shared blocks/themes + fragments + query index; Content Fragments only where content must be reused outside the site	Page templates are already available — no need to wait for a future approach

Everything below is supported out of the box with AEM authoring for Edge Delivery Services. The same code base (blocks, styles) is shared by every site, so a block built once is available on every page and every site.

---

1) Reusable Page Structure — reusable page templates or predefined sections (e.g. Event pages)

Answer: Yes. Use three building blocks together:

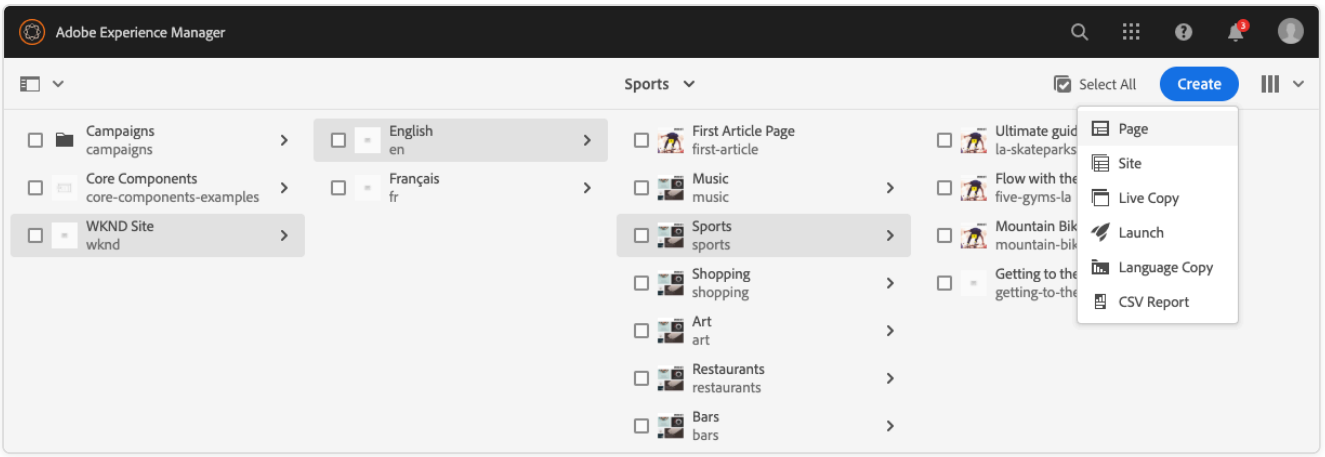

1a. Page templates in AEM (Universal Editor)

A **page template** is a master copy of a page layout. When an author creates a page from it, the template's content (sections, blocks, placeholder text) is copied into the new page. For Event pages, create one "Event" template page with the agreed sections, for example *Event hero (title, date, location, CTA) → Agenda → Speakers → Registration form → Related events*.

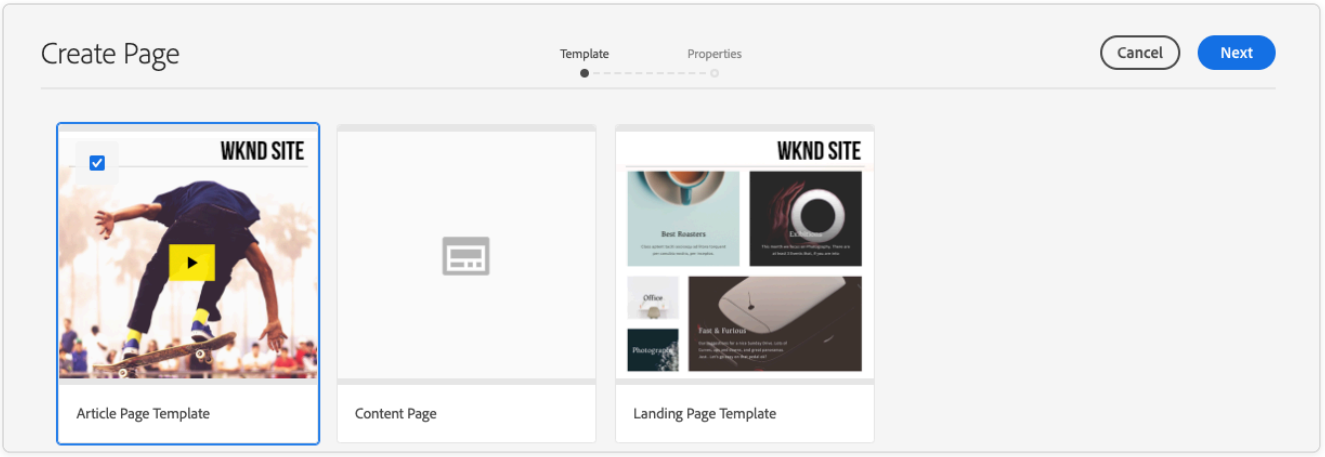

How to set it up (one time per site configuration):

1. **Enable editable templates** — Tools → General → Configuration Browser → select the site configuration → Properties → check **Editable Templates**.
2. **Allow templates for the site** — site root → Properties → Advanced → *Template Settings* → add `/conf/<site>/settings/wcm/templates/.*` to **Allowed Templates**.
3. **Turn a page into a template** — open the prepared Event page → Properties → Advanced → toggle **Use Page as Template** → Save & Close.

How authors use it — **Create → Page**, pick the **Event** template, fill in the title, done:

Source: Adobe Experience League — Creating Pages

Source: Adobe Experience League — Creating Pages

> Pages created from a template are **independent copies**: later changes to the template do not change existing pages. That is why the **look and feel lives in code** (1b), not in the template — design changes then apply to all Event pages at once.

1b. Template metadata — the same layout and fields for every Event page

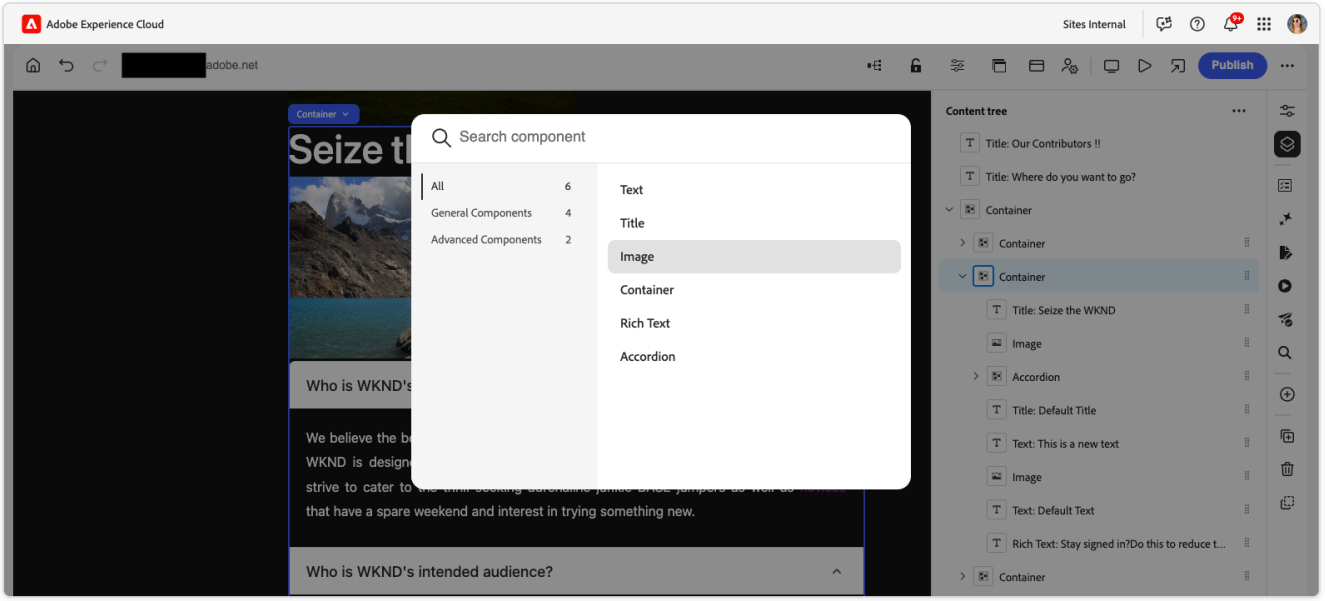

Each page has page properties (metadata). Setting the page's **template** metadata to `event` lets the site code apply the Event layout, styles and behavior to every Event page automatically (for example an event header, date badge, "Add to calendar", schema.org Event data). The template page from 1a sets this value, so authors never have to.

For AEM authoring projects, the page-properties form can also be **specific to a template** (a `event-metadata` model), so Event pages get their own fields such as

event date, location, registration link, event type — consistent data for every event, ready for listings (see 3).

1c. Predefined sections and allowed blocks

Developers define which **blocks** are allowed in which **section** (component filters) and which **section styles** exist (e.g. *highlight*, *light-grey*, *dark*). Authors pick from that list in the Universal Editor, so an Event page can only be built from approved Event building blocks:

Source: Adobe Experience League — Authoring Content with the Universal Editor

> For whole **sites** (not single pages), AEM also offers **Create → Site from template**, which creates a new site with its starting pages and configuration.

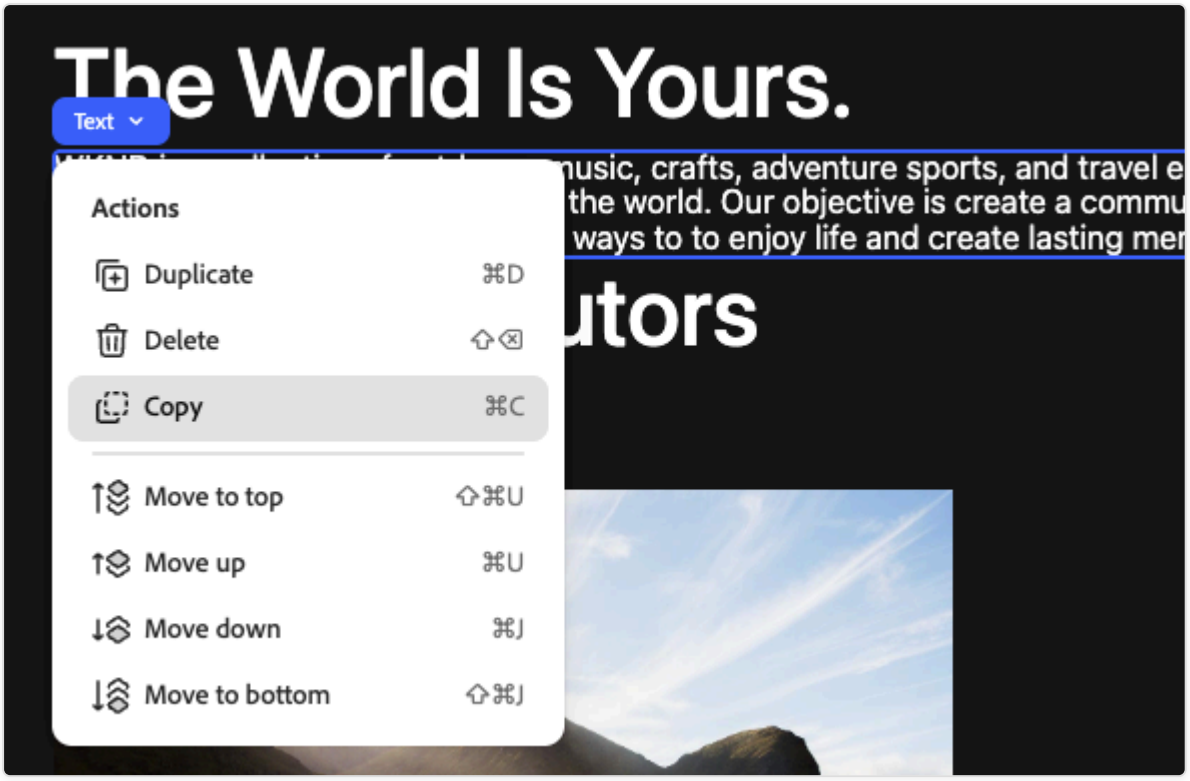

---

2) Block Reusability — copy and reuse blocks or sections across pages/sites without rebuilding them

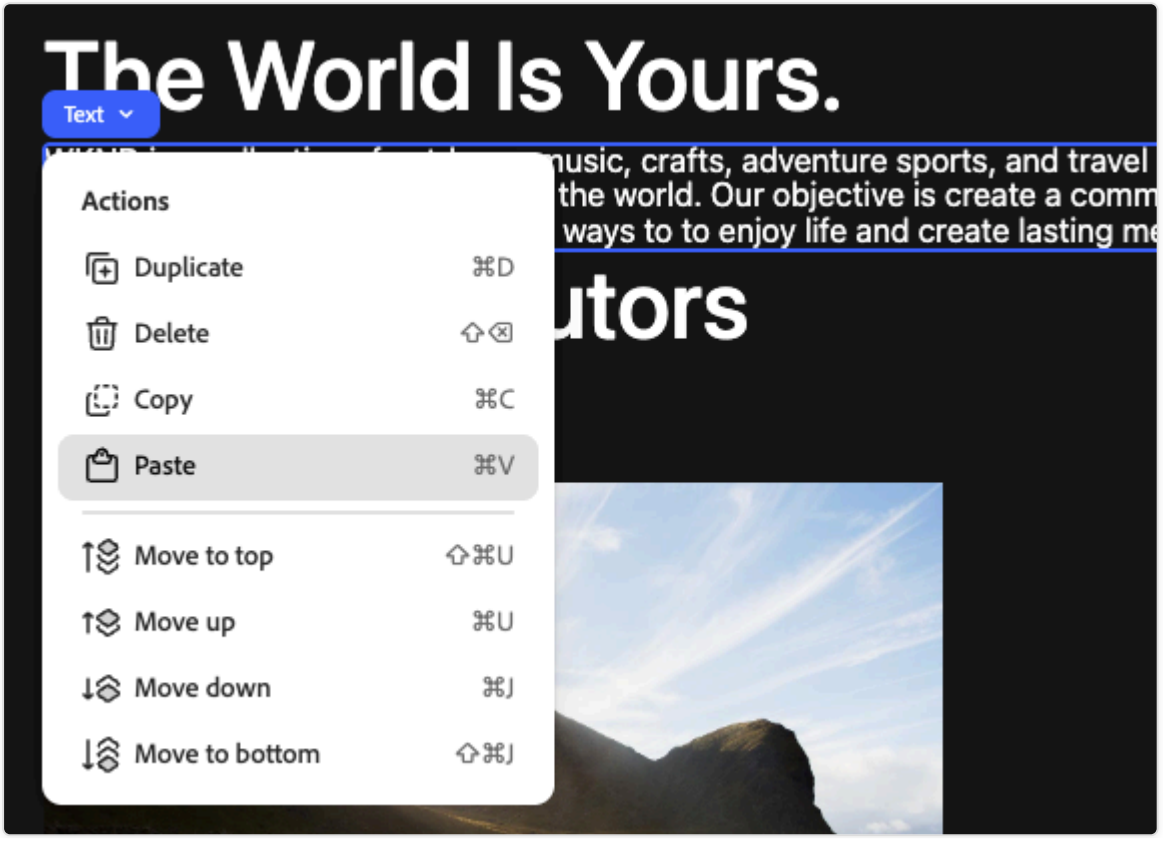

Answer: Yes, at four levels:

2a. Copy / Paste and Duplicate blocks in the Universal Editor

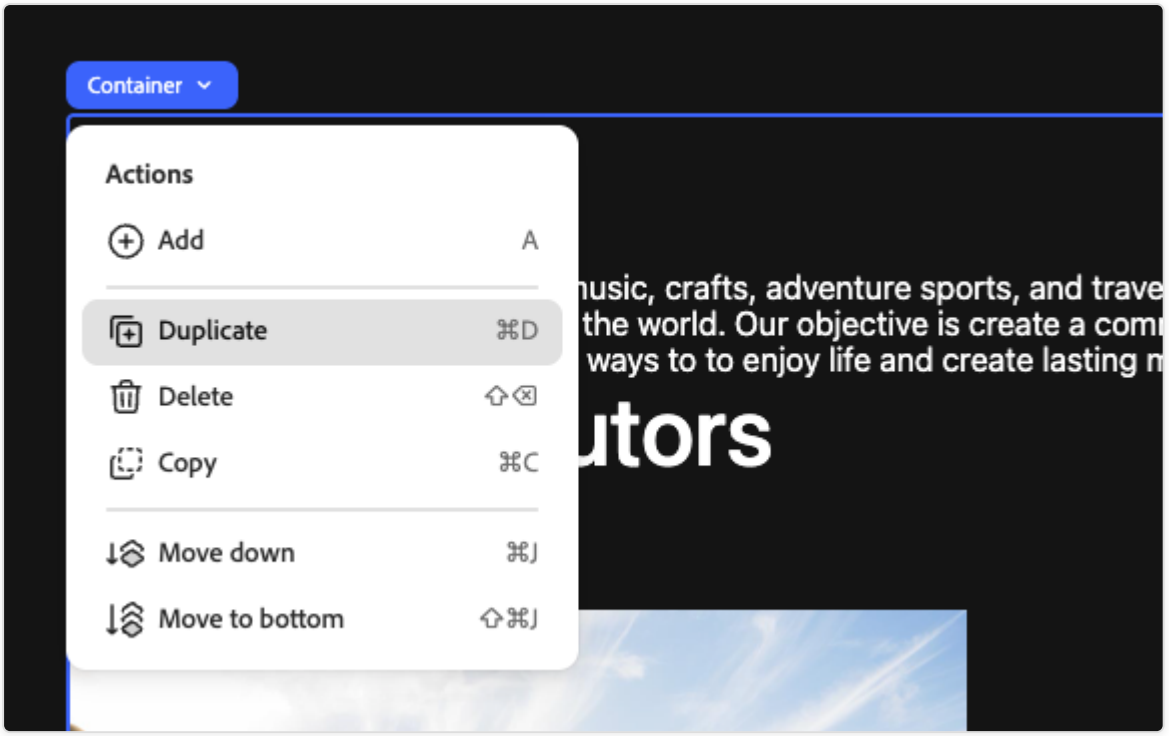

Select a block or section → **Copy** (properties panel or context menu) → select the target position → **Paste**. Copy and paste works within a page and **between pages open in different browser tabs**, as long as the target container allows that block. **Duplicate** inserts a copy right below the selected component.

Source: Adobe Experience League — Authoring Content with the Universal Editor

2b. Copy whole pages in the Sites console

Select a page → **Copy** → go to the target location → **Paste**. All sections and blocks come along, ready to edit:

2c. Fragments — author once, reuse everywhere

A **fragment** is a page (for example under `/fragments/`) whose content is placed on other pages with the **Fragment** block. Editing the fragment updates every page that uses it — one source of truth. Good fits: event registration banners, legal disclaimers, newsletter sign-up, shared CTAs, header and footer. Fragments can also be added automatically by template metadata (e.g. a banner on every Event page).

> Keep the main content of a page in the page itself; fragments are loaded client-side and are not indexed as part of the page that embeds them.

2d. Across sites and languages — MSM, Language Copies, Launches

Multi Site Management (MSM) rolls pages out from a **blueprint** to **live copies** (other sites, markets or languages). In the Universal Editor, an author's edit on a live copy automatically breaks inheritance for that change, so local edits are kept;

inheritance can be restored per page (Live Copy console / page properties) or per component with the **AEM MSM extension**.

Because all GE sites share the **same code base**, every block exists on every site — copied or rolled-out content renders the same way everywhere, without rebuilding blocks.

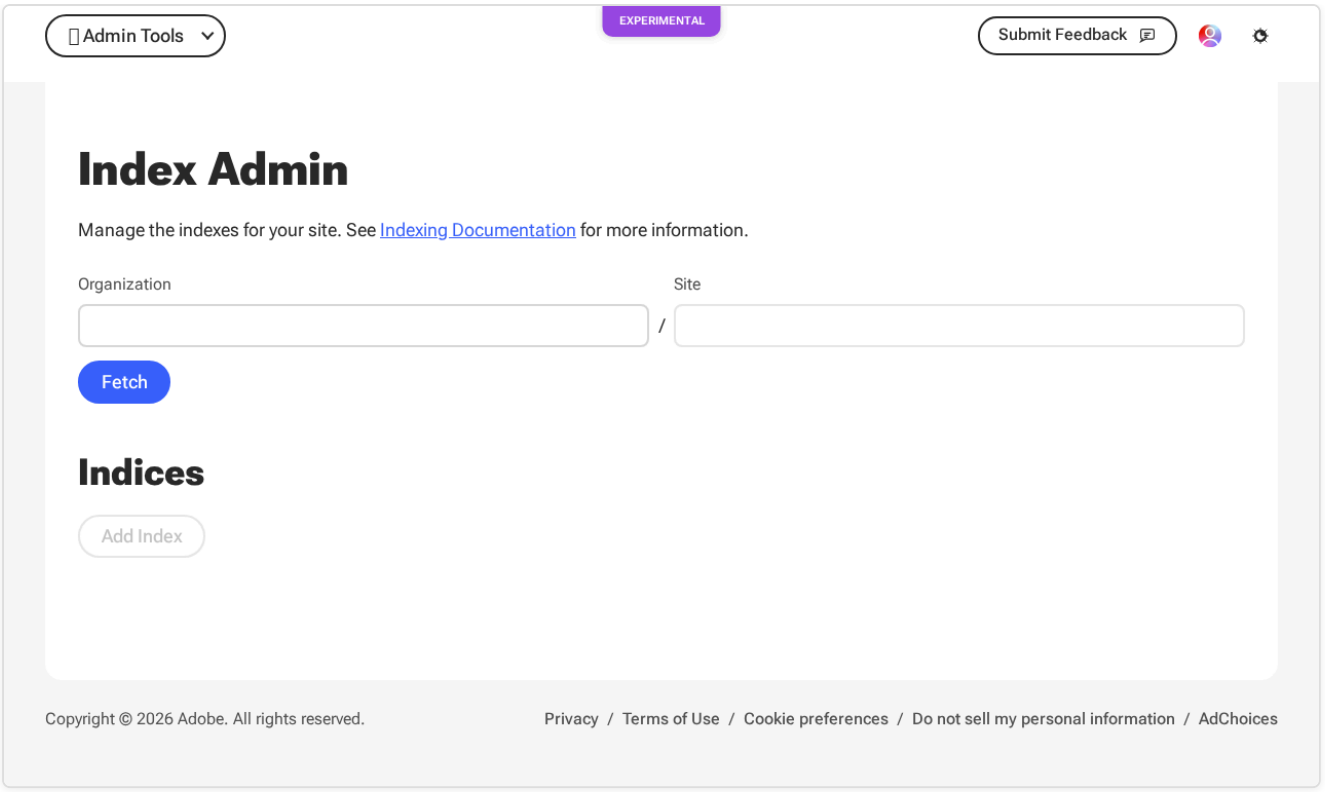

---

3) Articles & Insights — recommended approach

Recommendation: every News Article / Insight is a **page created from an Article page template**, described by **page metadata**, and all lists are generated from the **query index**.

Layer	What it gives you
Article page template (1a)	Same starting structure for every article: title, hero image, author/date line, body, related content
Article metadata (1b)	Fields per article: title, description, image, publish date, author, **category / tags** (AEM tags → taxonomy), content type (News, Insight, Press Release)
Query index	EDS keeps an index of all **published** pages with their metadata (`/query-index.json`); configured once with the **Index Admin** tool
Listing blocks	*Article list / cards*, *filter*, *pagination*, *related articles* read the index — new articles appear automatically when published, no manual list maintenance
Insights hub	A normal page with a listing block filtered by type/tag (e.g. all Insights, all articles about a topic)

Index configuration in the Index Admin tool (tools.aem.live):

Example from this migration — an article listing page (article cards with category, title, date and type) and an article page built with the same blocks and structure on Edge Delivery Services:

> In this migration the cards were migrated as authored content. With the recommended approach the same card block is filled from the query index, so editors only create the article page.

Optional — Content Fragments: if articles or press releases must also be reused outside the website (apps, other channels), they can be modelled as **AEM Content Fragments**, edited in the Universal Editor and published to Edge Delivery Services as pages. Use this only when that multi-channel need exists; for website-only articles, pages + metadata are simpler for authors.

---

4) Reusable Content Model — Events, Articles and Press Releases

Recommendation: combine the options — each one solves a different part. A template-based approach does not have to wait for the future: page templates for the Universal Editor are available today.

Need	Use	Why
Same starting structure per page type	**Page templates**: *Event*, *Article*, *Press Release*	Authors start from the right sections and blocks every time
Same look and feel / theme	**Shared blocks + section styles + template metadata** (layout in code)	One design change updates every page of that type; templates alone would not update existing pages
Same data per item	**Template-specific page metadata** (event date, location, author, tags, …)	Consistent fields that feed lists, filters, SEO and schema.org data
Content repeated on many pages	**Fragments**	Edit once, updates everywhere
Quick reuse while authoring	**Copy / Paste / Duplicate**, page copy	Fast, no developer needed
Same content on several sites / languages	**MSM live copies, language copies**	Central control with local overrides
Lists, feeds, "latest", "related"	**Query index + listing blocks**	Automatic, always up to date
Content reused outside the website	**Content Fragments** (optional)	Structured, multi-channel content

Suggested setup

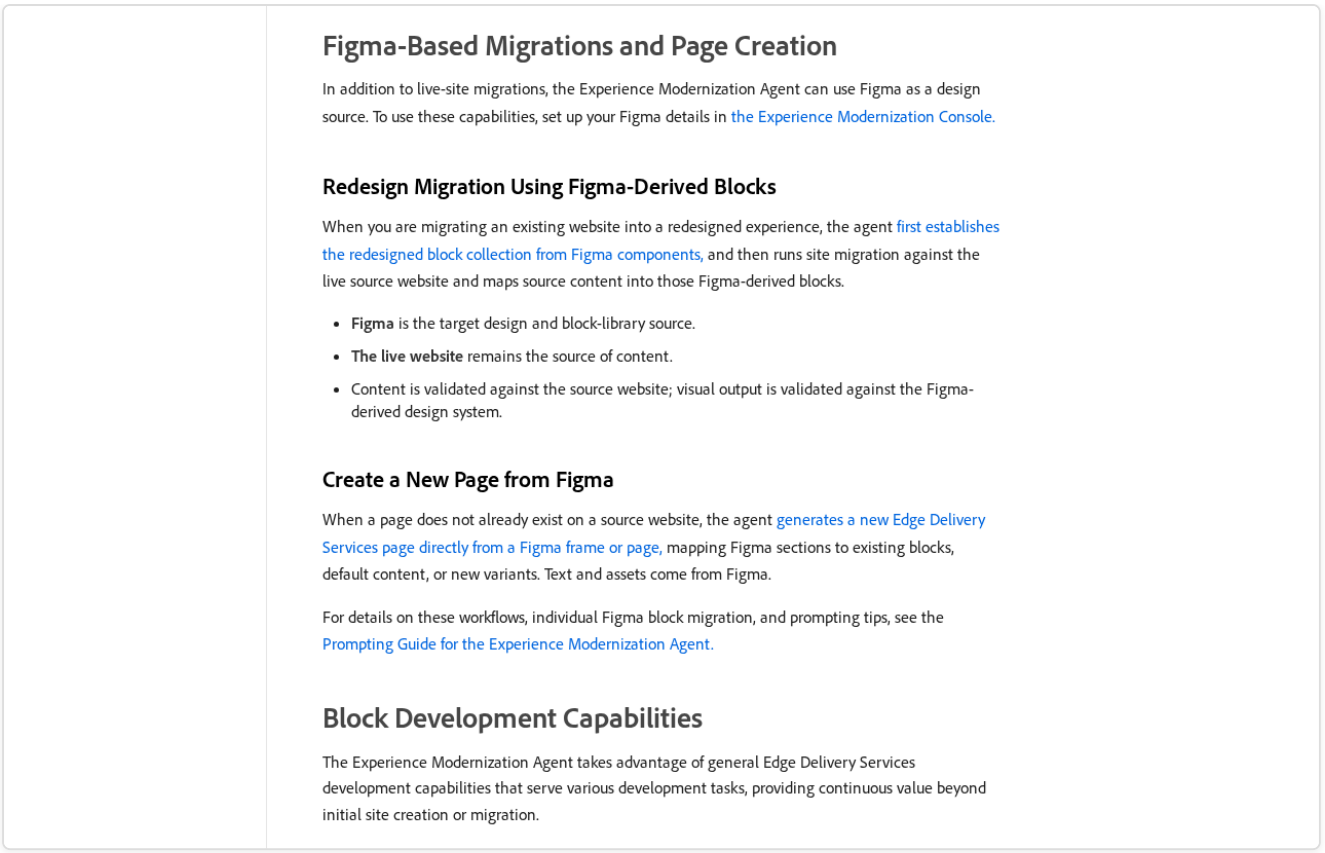

1. Define the three page types (Event, Article, Press Release) with the content team: sections, blocks, required metadata.
2. Build the blocks once (shared by all sites) and the template-specific layout and metadata models.
3. Create one template page per type and enable templates on the sites.
4. Configure the query index with the metadata the lists need (type, date, tags, image).
5. Add listing blocks for hubs (Events calendar, Newsroom, Insights).
6. Put shared pieces (registration banner, disclaimers, newsletter) in fragments.

Site creation from Figma — Adobe link (Experience Modernization Agent)

Adobe documents Figma support in the **Experience Modernization Agent Overview**, section *"Figma-Based Migrations and Page Creation"*:

- **Overview — Figma-Based Migrations and Page Creation:** https://experienceleague.adobe.com/en/docs/experience-manager-cloud-service/content/ai-in-aem/agents/brand-experience/modernization/overview#figma
- **Prompting Guide — Figma redesign migration:** https://experienceleague.adobe.com/en/docs/experience-manager-cloud-service/content/ai-in-aem/agents/brand-experience/modernization/prompting-guide#figma-redesign-migration
- **Prompting Guide — New page from Figma:** https://experienceleague.adobe.com/en/docs/experience-manager-cloud-service/content/ai-in-aem/agents/brand-experience/modernization/prompting-guide#figma-new-page-from-figma

What it says: the agent *"can use Figma as a design source"* (set up the Figma details in the Experience Modernization Console), supports a **redesign migration** where Figma components become the block library and content comes from the live site, and can **create a new Edge Delivery Services page directly from a Figma frame or page**. The overview also lists migrations from *"design systems (like Figma)"* under Site Creation and Migration Skills.

Figma-Based Migrations and Page Creation

In addition to live-site migrations, the Experience Modernization Agent can use Figma as a design source. To use these capabilities, set up your Figma details in the Experience Modernization Console.

Redesign Migration Using Figma-Derived Blocks

When you are migrating an existing website into a redesigned experience, the agent first establishes the redesigned block collection from Figma components, and then runs site migration against the live source website and maps source content into those Figma-derived blocks.

- **Figma** is the target design and block-library source.
- **The live website** remains the source of content.
- Content is validated against the source website; visual output is validated against the Figma-derived design system.

Create a New Page from Figma

When a page does not already exist on a source website, the agent generates a new Edge Delivery Services page directly from a Figma frame or page, mapping Figma sections to existing blocks, default content, or new variants. Text and assets come from Figma.

For details on these workflows, individual Figma block migration, and prompting tips, see the Prompting Guide for the Experience Modernization Agent.

Block Development Capabilities

The Experience Modernization Agent takes advantage of general Edge Delivery Services development capabilities that serve various development tasks, providing continuous value beyond initial site creation or migration.
